

# Overview of Deep Learning for NLP

---

*Viktor Schlegel*

# Motivation

**What this is:** high level overview with lots of pointers for self-study of relevant concepts, intuition

**What this isn't:** In-depth tutorial that will teach you deep learning so you go off and develop your own super deep and super neural supernetwork

**Where can i get this:** Coursework! Follow pointers! Resources Blackboard!

**Why so:** Deep Learning for NLP is its own semester long course, assuming you know deep learning by itself. Impossible to learn in 45 minutes.

**Positive:** less examinable stuff! **Negative:** self-study

# What this videos are about

## Covered:

- High level conceptual overview of deep learning for NLP
- Expressing NLP tasks as sequence processing problems
- Some details on sequence processing with neural networks

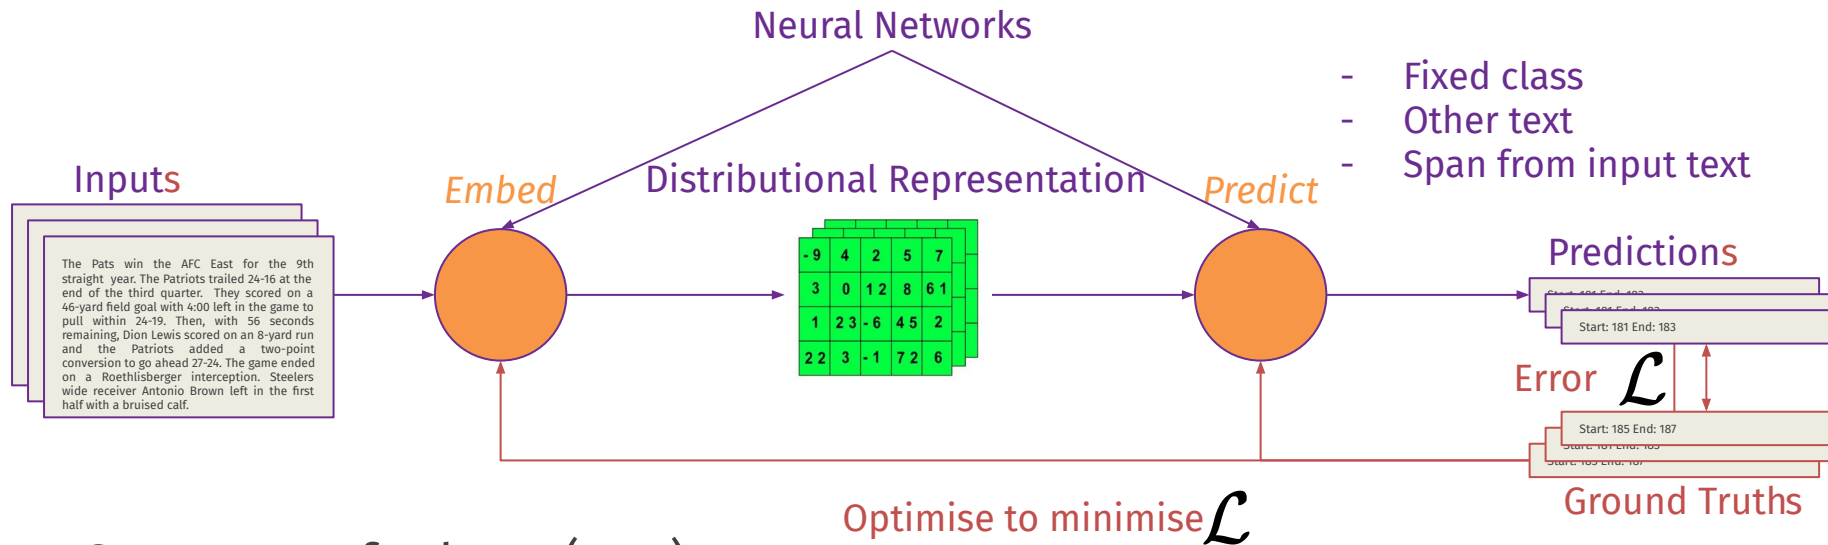

## Not covered:

- Details
- Depth
- Math

## Where can i get it?

- Follow the pointers
- Coursework!

# Data-driven approaches

Input: Sequence of tokens (text)

Possible tasks:

- Classify sequence
- Label tokens
- Generate another sequence
- Extract token span from input

Here: input is coordinates  
For us: input is text

# Geometrical view

# Learning a representation

## Traditional ML:

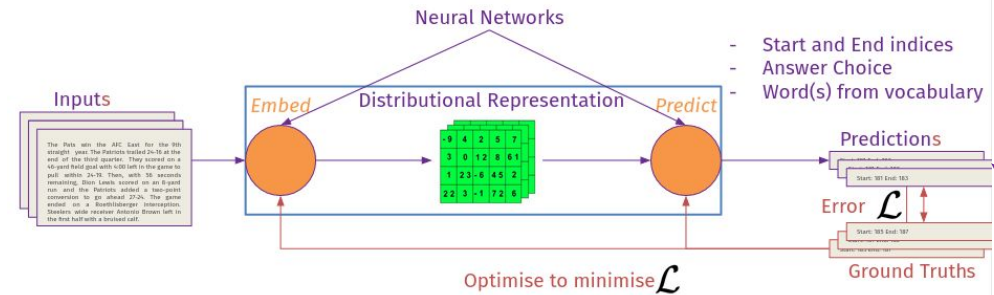

- decide on features (expert knowledge)
- learn their weight from training data

## Deep Learning:

- Learn to extract features from raw input (text, image, audio)

Weight	Feature
1.16	$(x, r, y)$ covers all words in $s$
0.50	The last preposition in $r$ is <i>for</i>
0.49	The last preposition in $r$ is <i>on</i>
0.46	The last preposition in $r$ is <i>of</i>
0.43	$len(s) \leq 10$ words
0.43	There is a WH-word to the left of $r$
0.42	$r$ matches VW*P from Figure 1
0.39	The last preposition in $r$ is <i>to</i>
0.25	The last preposition in $r$ is <i>in</i>
0.23	$10 \text{ words} < len(s) \leq 20 \text{ words}$
0.21	$s$ begins with $x$
0.16	$y$ is a proper noun
0.01	$x$ is a proper noun
-0.30	There is an NP to the left of $x$ in $s$
-0.43	$20 \text{ words} < len(s)$
-0.61	$r$ matches V from Figure 1
-0.65	There is a preposition to the left of $x$ in $s$
-0.81	There is an NP to the right of $y$ in $s$
-0.93	Coord. conjunction to the left of $r$ in $s$

# Data

- For now, let's not focus on how this representation is learned (we will take a closer look later)
- Simplifying assumption: assume we express an NLP task as a set of textual inputs and expected outputs  
→ a neural network will learn the **underlying statistical patterns** to succeed at the task  
(provided strong enough signal, representative training data, and much, much more)
- How do we represent NLP tasks as input/output pairs?

# NLP as time series analysis

Sequence = time series

time series = data points, indexed in time order

data points = words in text

time order = order appearance in text

We will be looking at:

- Sequence classification
- Sequence labelling
- Sequence extraction
- Sequence to Sequence translation

# Sequence classification

*S1: I like trains.*

*S2: The train is arriving on time.*

Input text

The Pats win the AFC East for the 9th straight year. The Patriots trailed 24-16 at the end of the third quarter. They scored on a 46-yard field goal with 4:00 left in the game to pull within 24-19. Then, with 56 seconds remaining, Dion Lewis scored on an 8-yard run and the Patriots added a two-point conversion to go ahead 27-24. The game ended on a Roethlisberger interception. Steelers wide receiver Antonio Brown left in the first half with a bruised calf.

Classifier

*{Paraphrase,  
NoParaphrase}*

Possible classes

Probability distribution

*{Paraphrase: 0.1,  
NoParaphrase: 0.9}*

Applicable NLP tasks:

- Sentiment analysis
- textual entailment
- paraphrasing
- question type classification

$I : \{start: 0.8, end: 0.01\}$   
 $like : \{start: 0.1, end: 0.9\}$   
 $trains : \{start: 0.05, end: 0.05\}$   
 $\therefore \{start: 0.05, end: 0.04\}$   
 $\Rightarrow [0, 1): I$

# Span extraction

*P: I like trains.*

*Q: Who likes trains?*

Input text

Classifier

The Pats win the AFC East for the 9th straight year. The Patriots trailed 24-16 at the end of the third quarter. They scored on a 46-yard field goal with 4:00 left in the game to pull within 24-19. Then, with 56 seconds remaining, Dion Lewis scored on an 8-yard run and the Patriots added a two-point conversion to go ahead 27-24. The game ended on a Roethlisberger interception. Steelers wide receiver Antonio Brown left in the first half with a bruised calf.

Probability distribution of token being start/end of extracted span

Applicable NLP tasks:

- Question Answering
- Relation Extraction

# Sequence labelling

*I like trains.*

Input text

The Pats win the AFC East for the 9th straight year. The Patriots trailed 24-16 at the end of the third quarter. They scored on a 46-yard field goal with 4:00 left in the game to pull within 24-19. Then, with 56 seconds remaining, Dion Lewis scored on an 8-yard run and the Patriots added a two-point conversion to go ahead 27-24. The game ended on a Roethlisberger interception. Steelers wide receiver Antonio Brown left in the first half with a bruised calf.

Token  
Classifier

Applicable NLP tasks:

- POS tagging
- Named Entity Recognition
- OpenIE, Semantic Role Labelling
- question type classification

Probability distribution for each token

*I* : {PRP: 0.85, NN: 0.01, DET: 0.01 ...}  
*like* : {VBP: 0.7, VBD: 0.2, .... }  
*trains* : {NNS: 0.6, NN: 0.2 ... }  
*.* : { . : 0.99, UH: 0.001 ... }  
 $\Rightarrow$  *I*/PRP *like*/VBP *trains*/NNS *.*/.

# Sequence to sequence

*I like trains.*

Output text

Words in the target vocabulary

{я, самолет, зачем, поезда, ... }

Probability distribution of next word given input and output sequence so far

я : {я: 0.85, ты: 0.01, мы: ...  
люблю : {люблю: 0.7, пошел: .... }  
поезда : {поезда: 0.6, тебя: 0.2 ... }  
.: {.: 0.99, УН: 0.001 ... }  
⇒ я люблю поезда.

Applicable NLP tasks:

- Translation
- Abstractive Summarisation
- Text generation
- Question answering

<http://www.statmt.org/wmt14/translation-task.html>

## Sequence what?

What about parsing? E.g. dependency parsing? In general where the output is neither a class nor a span nor a sequence?

⇒ Arguably, many lower-level tasks in the NLP pipeline can be omitted in favour of end-to-end modelling of the problem. But lower-level tasks are also interesting in themselves

⇒ more tricky approaches, combine encoding and parsing or more complex architecture <sup>1</sup>

1: For dependency parsing, see e.g.: <https://www.aclweb.org/anthology/Q16-1023.pdf>  
And coreference resolution: <https://www.aclweb.org/anthology/D17-1018/>

# Why?

- Deep learning for NLP would make a great 1-semester course by itself, building on top of a general deep learning course
- Can't fit everything into 1 week's lecture
- Focus on “what” can be done, not “how”.
  - Knowing “how” it works doesn't necessarily inform whether it will work in some particular instance, so experiments are needed anyways.
  - Learning “how” is best done hands-on, requires time

## Motivation 2

Focus on “what”, not on “how” (and not “why”).

- even if you know the “how”, the “what” requires a lot of experimentation
- ⇒ better to learn “hands-on”, requires time
- ⇒ coursework, pointers, time
